

## Truss Jib

Truss Jib - Truss jib's can be used to pick up, move and position trusses. The additional part is designed to function as an extended jib additional part along with a triangular or pyramid shaped frame. Typically, truss jibs are mounted on equipment like for instance a skid steer loader, a compact telehandler or even a forklift making use of a quick-coupler accessory.

Older models of cranes have deep triangular truss jibs which are assembled from standard open structural shapes that are fastened utilizing rivets or bolts. On these style jibs, there are little if any welds. Each riveted or bolted joint is susceptible to rusting and thus requires frequent maintenance and check up.

Truss jibs are built with a back-to-back collection of lacing members separated by the width of the flange thickness of an additional structural member. This design could cause narrow separation amid the smooth exteriors of the lacings. There is little room and limited access to clean and preserve them against corrosion. A lot of rivets become loose and corrode in their bores and should be replaced.
